

The WAGER, Vol. 21(2) - Problem gambling has more to do with how you gamble than where you do it.

February 3, 2016

Does gambling on the internet predispose people to gambling-related problems? Some early research suggested that people who gamble online are more likely than other gamblers to have gambling-related problems.[\[1\]](#) More recent evidence suggests that gambling involvement— either gambling more frequently or playing lots of different types of games—is associated with gambling problems.[\[2\]](#) This week, The WAGER reviews research by [Sally Gainsbury and colleagues](#) that explored the relationship between how people gamble and the problems they experience.

What was the research question?

Do people who gamble *both* at gambling facilities *and* online experience more gambling-related problems than those who gamble only at gambling facilities or only online?

What did the researchers do?

Dr. Gainsbury and her colleagues used Internet ads to recruit 4,594 Australian gamblers to complete an online survey. They compared participants who gambled only at gambling facilities, only online, and both at gambling facilities and online. Participants answered questions about gambling problems using the Problem Gambling Severity Index (PGSI), which groups participants into 4 categories: no gambling problems, low risk for gambling problems, moderate risk for gambling problems, and evidence of gambling problems.[\[3\]](#)

What did they find?

Participants who gambled both online and at gambling facilities were more likely to report gambling problems than those who only gambled online. In addition, gamblers who used both the Internet and gambling facilities were least likely to be in the “no gambling problems” group. See Figure.

Why do these findings matter?

Some people think that Internet gambling is a cause of gambling related problems. Their solution is to ban or at least tightly regulate Internet gambling. However, this study suggests that Internet gambling might not be a cause of gambling problems. If Internet gambling were the source of the problem, then we would expect to see higher rates of problem gambling among any who gambled online compared to those who only gambled in gambling facilities. The results of this study support previous research that people who gambled in many different ways are at especially high risk for gambling problems.[\[4\]](#)

Every study has limitations. What about this one?

The study sample includes only Australian gamblers who have access to the Internet and responded to study ads. This limits generalizability to those without Internet access and to other jurisdictions where the modes and types of gambling available might differ.
