

STASH, Vol. 14(4) - Marijuana use and perceptions among 12th graders in response to legalization

April 17, 2018

Medical and recreational marijuana have become increasingly [available](#) to American adults over the past two decades. Some fear that increased availability might make adolescents view marijuana as harmless, despite the fact that adolescents who use marijuana regularly are at risk for altered [brain development](#) and/or low [academic achievement](#). This week, STASH reviews a study by [Aaron Sarvet](#) and colleagues that explores how perceptions and use of marijuana among 12th-graders have evolved over the past two decades.

What is the research question?

Does increased availability of marijuana change 12th-grader perceptions of marijuana-related health risks? How do these perceptions relate to marijuana usage?

What did the researchers do?

The researchers assessed data collected from two [cross-sectional, nationally-representative](#) surveys of 12th-graders: (1) the [Monitoring the Future study](#) (MTF; 369,899 12th-graders) and (2) the [National Survey on Drug Use and Health](#) (NSDUH; 35,530 12th-graders). Participants responded to questions about frequency of marijuana use during the past-30 days and perceived harmfulness of regular marijuana use. The researchers considered participants “regular marijuana users” if they reported twenty or more days of marijuana use in the past 30 days. The researchers calculated annual averages of past-30 day marijuana use and perceived harmfulness of regular marijuana use.

What did they find?

In both [samples](#), reported past-30 day use of marijuana remained stable over the study period. However, in both samples, perception that marijuana is harmless increased from about 7% around 2007 to between 21-24% around 2014. (See Figure 1).

12th grade student perceptions that smoking marijuana regularly is risk free and rates of past-30-day regular marijuana usage across time

Figure. Note: These line graphs report only partial data from available percentages reported in the original article. MTF reported annually from 1991 to 2015. NSDUH reported annually from 2002 to 2014. See [page 71](#) for a comprehensive line graph of each year. Click image to enlarge.

Why do these findings matter?

Some fear that legalization leads to increased marijuana usage among adolescents. This fear is challenged by the observed increases in perception that marijuana is harmless, paired with stable rates of daily use over time. Barriers to access and cost might be additional factors that limit marijuana use among this group. These findings suggest that the continued use of well-designed and long-term studies can help policymakers make informed decisions about the true effect of legalization.

Every study has limitations. What were the limitations in this study?

[Self-reported](#) marijuana use might not be an accurate representation of actual marijuana use. Participants might alter their responses if they fear legal consequences or parental notification of marijuana use behaviors. The researchers did not ask questions about where participants obtained their marijuana. These sources are important considerations when policy makers or activists make claims about how legalization impacts youth marijuana use. It is also possible that marijuana use might have decreased instead of remaining flat over time if legalization had not occurred.
